Research Interests

Synthetic Organic Chemistry

My research group is primarily concerned with the design and development of new and efficient stereo- and enantioselective strategies that do not have precedence in classical organic chemistry for the synthesis of important complex molecular structures.

We are particularly interested in developing carbon-carbon bond forming processes, which efficiently create multiple stereocenters. We place a special emphasis on mechanistic investigation to give insight into the origins of chemo- and stereoselectivity of discovered processes. Deep understanding of reaction mechanisms governs our optimization work towards identifying the most efficient and general protocols and allows for expanding the scope of our methodologies.
